

One of the most important reasons why I would like to study in Japan is to get a high level education. Japan - one of the best-developed countries in the world with well-organized health care system, treatment strategy and new technologies in the field of surgery, biomedical sciences, regenerative medicine.

I had the opportunity to study in Japan under supervision of professor Susumu Eguchi in the Department of Surgery, Nagasaki University Graduate School of Biomedical Sciences. I lived and studied in Japan last four years and it was one the wonderful and important times for me. Study in the department under prof. Eguchi provided me excellent experiences that introduced me to the surgical environment and scientific process. Working with a team of scientists, the primary focus of the main research was to investigate the liver tissue engineering. I learnt many new experiences from my Japanese colleagues and really enjoyed working there and made many new friends I keep contact with.

All members of the department accepted me very warm and kindly brought to their big family. The department of surgery is very well organized team, and all of the members who I had met during my staying are big professionals. Furthermore, during my staying in Japan, I met many people including colleagues from other parts of Japan and other countries which also was helpful for me.

The knowledge that I received in Japan definitely will bring great benefit to the development of biomedical sciences, surgery and organ transplantation in Kazakhstan. I was in a good place and friendly environment which has given me a positive attitude to working and now has aimed me in the right direction to what I want to do and how to go about achieving it. I am very looking forward to see our department (Nigeke) again!

どうもありがとうございました!

Sincerely, Zhassulan Baimakhanov
